

Where does execution first go wrong?

Same 1,350 graphs at each N · 345,600 paired queries · counts 1–256

No incorrect C letter at any loop 1...N

First incorrect intermediate C letter
42 fail; 1,308 / 1,350 remain error-free

First error means an intermediate letter mismatch, NOT a final-answer/timing failure. Denominator stays 1,350 at every N.
Each failing graph contributes once; error-free graphs are observed only through the maximum tested depth.
Shading: pointwise 95% graph-level Wilson intervals; repeated horizons are paired, not independent.
