

Intermediate execution readouts

1,350 independent graphs · 345,600 paired queries · every count 1-256

Decoded states at each recurrent loop

Next-step accuracy given a correct prefix

Dotted lines: R training unroll 12 · largest trained count 63 · three-digit boundary 100.

Conditional accuracy uses only graphs correct at every preceding loop; these are descriptive rates without CI bands.
